

Orion for Process Control

The Orion Automation Platform acquires data for energy management and "islands of automation" applications in process environments by connecting with legacy, proprietary, and unsupported PLCs, Intelligent Electronic Devices (IEDs) and converting their outputs to open protocols including Modbus TCP.

Energy Management Information

Amps, watts, volts, vars, frequency, and breaker status, are presented by Orion to the D/3® DCS as part of the NovaTech [Energy Management Solution](#).

Integrate Islands of Automation

Flexible communication options and a wealth of protocol emulation know-how allow Orion to connect isolated data assets into the D/3 DCS or other process automation systems.
